

Progress In Analytical Technology In Central Research Laboratories

Kenji KARUBE*

Abstract

Following the establishment of the Central Research Laboratories in Hiratsuka, some of the analytical instruments were relocated from the original research laboratories in Ikegami. However, Nihon Parkerizing introduced an array of advanced analytical instruments to the new laboratories. In particular, most of the analyzers for analyzing the structure of coating surfaces and the molecular structures of organic compounds were introduced at this time, and the Laboratories' analytical capabilities enhanced dramatically. In this report, we would like to introduce the process of improving our analysis technology, citing research results using these devices.
